I/O and File Handling

Exercises

Week 8

Prior to attempting these exercises ensure you have read the lecture notes and/or viewed the video, and followed the practical. You may wish to use the Python interpreter in interactive mode to help work out the solutions to some of the questions.

Download and store this document within your own filespace, so the contents can be edited. You will be able to refer to it during the test in Week 6.

Enter your answers directly into the highlighted boxes.

For more information about the module delivery, assessment and feedback please refer to the module within the MyBeckett portal.

Which of the following represents a Python *f-string*?

- a) "Hello {}, you have logged in".format(name)
- b) "Hello {name}, you have logged in"
- c) f"Hello {name}, you have logged in"
- d) "Hello %s, you have logged in" % name

Answer:

f"Hello {name}, you have logged in"

Given the following definition of value, what would each of the following statements display?

```
value = 10.768572
print(f"Value is {value}")
```

Given the following definition of value, each of the following statements would display: Value is 10.768572

```
print(f"Value is {value * 10}")
```

Answer:

Value is 107.68572

```
print(f"Value is {value:.2f}")
```

Answer:

Value is 10.77

```
print(f"Value is {value:16.2f}")
```

Answer:

Value is 10.77

```
print(f"Value is {value:0>16.2f}")
```

Answer:

Value is 00000000010.77

Within an f-string format specifier what does the '^' alignment character signify?

Answer:

In a Python f-string format specifier, the ^ character is used as an alignment option. Specifically, it represents the "center" alignment.

Write a statement which uses the str.format() to generate the same output as

```
print(f"pi to 5 decimal places is {math.pi:.5f}")
```

Answer:

formatted_string = "pi to 5 decimal places is {:.5f}".format(math.pi)

What would the following statement display?

```
print("Length = {1} Width = {0}".format(10,20))
```

Answer:

The given str.format() statement will display: Length = 20 Width = 10

What exactly would the following statement display?

```
print("Hello".rjust(10))
```

Answer:

The following statement will display
Hello

On which older programming language is the *%-formatting* style loosely based? *Answer:*

The % formatting style is used in the C programming language.

Write a Python program that uses a loop and the str.rjust() method to generate the following output.

Hint: The program will start as follows

```
for n in range(10,0,-1):
   line = "#" * n
# rest of code....
```

Answer:

```
for n in range(10, 0, -1):
line = "#" * n
print(line.rjust(10))
```

_ What is the basic element that all computer files contain?

Answer:

The basic element that all computer files contain is data.

What function must be called before the contents of a file can be accessed? Answer:

The open() function must be called before the contents of a file can be accessed.

_ What *method* must be called on a file object once processing is complete? *Answer:*

The close() method must be called on a file object once processing is complete

Following execution of the given statement, would the file 'myfile.txt' be open for reading or for writing?

```
f = open("myfile.txt")
```

Answer:

The given statement will be run, opening the file "myfile.txt" for reading.

Following execution of the given statement, would the file yourfile.txt be open for *reading* or for *writing*?

```
f2 = open("yourfile.txt", "w")
```

Answer:

The file "yourfile.txt" would be open for writing after the given statement is executed.

Following execution of the given statement, what would be the *mode of operation* applied to file <code>gfxlib.so</code> ?

```
f3 = open("gfxlib.so", "r+b")
```

Answer:

The mode of operation applied to the file "gfxlib.so" would be read and write in binary mode ("r+b") after the given statement is executed.

What is the difference between the two following method calls?

```
f.readline()
f.readlines()
```

Answer:

f.readline() reads a single line from the file,
f.readlines() reads all lines from the file and returns them as a list of strings.

_ How much of the file content would be read with the following method call? content =
f.read()

Answer:

With the method call content = f.read(), the entire content of the file will be read into the variable content.

_ If the variable 'my_file' referred to a text file, what would the following code do?

```
for next in my_file:
    print(next)
```

Answer:

The code iterates through the lines of the text file referred to by the variable my_file and prints each line to the console.

What is the issue with the following code? And how could it be fixed?

```
f = open("details.txt", "w")
total = 100
f.write(total)
f.close()
```

Answer:

The issue is that the write() method expects a string, but the variable total is an integer.

To fix it, convert total to a string using str(total) before writing it to the file.

What is the purpose of the file tell() method?

Answer:

The file cursor's current byte position within the file can be found using the file handling tell() method.

_ What does the following code do?

```
f.seek(0)
```

Answer:

The code f.seek(0) moves the file cursor to the beginning of the file (offset 0). It sets the file pointer to the start of the file, allowing subsequent read or write operations to start from the beginning.

_ Why is file handling often done using a 'with' statement as shown below?

```
with open("data.txt") as f:
    lines = f.readlines()
```

Answer:

Using a with statement in file handling ensures automatic opening and closing of the file, simplifies code, and provides better exception handling.

Exercises are complete

Save this logbook with your answers. Then ask your tutor to check your responses to each question.
